‘Hydrogen-ready’ feature

The study team asks whether it can be recommended to policymakers to introduce a ‘hydrogen-ready’ feature or any other feature as an enabling tool to further decarbonise the heating sector and to facilitate hydrogen injection in the gas grid. While the idea has some merit, we believe Ecodesign and energy labelling are not the best place to introduce such a supportive measure, as it is not directly linked to energy efficiency.

Even more importantly, we would like to point out that if such measure was to be further considered by the European Commission, it would be crucial to make sure that it remains technology-neutral, and that it is extended to cover other types of renewable gases such as bioLPG, which is not distributed through the grid.

Liquid Gas Europe

LPG - The smart alternative, everywhere you need it

Liquid Gas Europe’s membership is composed by national LPG associations, the main European LPG suppliers, distributors and equipment manufacturers. With the support of its working groups of industry experts, Liquid Gas Europe is actively involved in concrete initiatives and programs to ensure the sustainable, safe and efficient development of LPG in Europe.
